

GENERAL INFORMATION: 25.4 SL MTB STEM

Rotor SL MTB Stem 25.4; 83 grams

A record setting in low weight and incredible rigidity is the main attraction to this amazing stem and is ideal for those looking for the latest and greatest, as well as those looking for a unique stem.

Applying ROTOR's new DTT Evo Technology in the faceplate and the steerer clamp, we are able to achieve an incredible tightening force and its weight reduced to a minimum without sacrificing performance; we all know that a stem is the last thing you want to fail. DTT Evo bolts have been redesigned with a new dual-thread pitch design and use a T25 Torx head. Using a T25 design allows for reliable tightening without rounding out the head of the bolt, in turn, we ensure reliable clamping regardless of the handlebar in use.

At an angle of +/- 6° it can be oriented in a downward position in favor of an aggressive position, or oriented upward to provide a more comfortable position. The faceplate is only available in black color.

The ROTOR SL stem is exclusively for use with 25.4mm MTB handlebars and are not to be used on traditional road bars of 26.0/25.8mm diameter.
