

ROTOR SX STEM

The ROTOR SX stem has surpassed the clamping force and stiffness already found on our S1 stem with a total of four (4) faceplate bolts. The only weight penalty is an additional 7g over the S1, but this small amount of weight provides extreme rigidity while maintaining its good looks.

The SX introduces our new DTT Evo bolts which are easier to install, beefier size and with a greater tightening capacity. Initially oriented to enduro and all-mountain type of riding, the SX has become the perfect option for road and cyclocross use, mainly due to their light weight; it's also perfect for those who just want their bicycle's front end to have a beefy and strong look.

The new DTT Evo bolts have a redesigned thread pitch and replace the old 3mm allen with the use of a T25 torx bolt. This new design is found to be more user friendly, and will surely and securely clamp down any bar that is put in its path.

The SX stem is available for oversized (31.8mm) bars in 80, 90, 100, 110, and 120mm lengths with a +/- 2.5° rise at an incredible low weight (103g for 80mm). Its almost-neutral angle is very relaxed and is ideal for the rider looking for a slightly higher position and to improve comfort. If you are looking for a more aggressive riding position, then you may find the S1 to be the perfect stem for you.

Like the S1, the SX is available with your choice of either red or black faceplate so you can choose a color that best matches your bike.
